

Important Information about **Human Papillomavirus (HPV)** and Human Papillomavirus (HPV) Vaccine

PLEASE READ THIS CAREFULLY

What is Human Papillomavirus (HPV)?

- HPV is a very common virus that is spread from person to person by close physical contact like skin-to-skin contact or sexual activity. This includes vaginal, anal and oral sex between people of any gender.
- There are over 100 types of HPV that can infect different parts of the body.
- It is estimated that as many as 75% (3 out of 4) people will get HPV at some point in their lives.
- Many people who have HPV don't even know it, as it often has no symptoms. HPV is still contagious, even without visible symptoms.
- Visible symptoms of HPV include skin growths (warts) on places such as your hands, feet, genitals, or anus.
- In more serious cases, certain types of HPV are linked to cancers, including those of the head, neck, throat, cervix, vulva, anus and penis.
- People may think that cancer only affects older people or that you don't have to worry about preventing cancer when you are young, but this is not true. HPV-related cancers can happen as early as your twenties, and the risk increases as you get older.
- It is preventable through immunization.

What is the HPV vaccine?

- The HPV vaccine offers protection against the most harmful types of HPV that can cause genital warts and cancer.
- The most effective way to prevent HPV is to receive the vaccine before becoming sexually active.
- Like with any other vaccine, HPV vaccine works best when it is given before you are exposed to the virus.

Who should receive the HPV vaccine?

- In Nova Scotia, the HPV vaccine is routinely offered to grade 7 students as part of the School Immunization Program. If the vaccine was missed or refused in the grade 7 School Immunization Program, people can still get the vaccine for free as part of this program until 19 years of age.
- People under 46 years of age who are considered to be at higher risk of getting HPV can also get the HPV vaccine for free. This includes:
 - » Men who have sex with men
 - » People living with Human Immunodeficiency Virus (HIV)

To ensure the best possible protection against HPV, people should receive all vaccine doses they're eligible for.

CAUTION

Who should NOT receive the HPV vaccine?

- People who have had a serious allergic reaction to a previous dose or any component of the HPV vaccine.
- People who are sick or have a fever (temperature of 38.5°C/101.3°F or greater).

Please read other side.

What to Expect Following Immunization with **Human Papillomavirus (HPV) Vaccine**

VACCINE INFORMATION

People should stay in the clinic for at least 15 minutes after receiving any type of immunization to monitor possible reaction. As with any vaccine there is a slight possibility that a more serious reaction could occur.

What are the possible side effects of the HPV vaccine?

- As with all vaccines, the most common symptoms experienced following the HPV vaccine are soreness, redness, and swelling at the injection site, headache, fever, and nausea.

Over-the-counter pain relievers such as ibuprofen (e.g., Advil) and acetaminophen (e.g., Tylenol) can be used to manage symptoms following vaccination, including fever. Some people should not take these medications. Talk to your health care provider or pharmacist if you have questions, or are unsure if you should take these.

Call your health care provider if:

- You have a fever of 38.5°C (101.3°F) or higher.
- The fever lasts longer than 24 hours.
- Your fever doesn't come down after acetaminophen or ibuprofen are taken.
- You are ill with other symptoms.

Questions?

If you have any questions about Human Papillomavirus (HPV) or the HPV vaccine, please call your local Public Health office (see list of offices here: www.nshealth.ca/public-health-offices) or your health care provider.
