

# Telemetry

- A member of your health care team will tell you what activities you can do while you are having telemetry.
- Your nurse will change the batteries in the transmitter when needed.
- To lower the chance of skin irritation from the electrodes, your nurse will change them every day.

**Call the nurse using your call bell if you have any of the symptoms that caused you to get medical help, or if you:**

- > **have chest pain.**
- > **feel your heart pounding.**
- > **feel dizzy or faint (light-headed).**

# Telemetry

## What is telemetry?

Telemetry is a way of recording your heart's rate and rhythm while you are in the hospital. A transmitter is used to send this information to a monitor at the nurses' station. The recording happens while you are awake and while you are asleep.

## Why is telemetry done?

Telemetry may be done to help your health care provider:

- › Diagnose problems with your heart's rhythm
- › Check fainting spells
- › Check a fast or slow heart rate
- › Check how your heart responds to medication
- › Check your heart after a pacemaker or implantable cardioverter defibrillator (ICD) is put in

## Where is telemetry done?

- You will be monitored with telemetry while you are in the nursing unit.
- **Do not** leave the nursing unit. Telemetry will not transmit to the monitor if you leave the nursing unit.

- If you need to go to another department in the hospital, the nurse will stop the monitoring until you come back.

## How is telemetry done?

- A nurse will put sticky patches called electrodes on your chest. If needed, a member of your health care team may shave a small area on your chest. This is to make sure the electrodes stick to your skin.
- The electrodes are attached by wires to a small machine called a transmitter. The transmitter is about the size of a cell phone.
- Put the transmitter in your pocket or a pouch. This prevents pulling on the wires, so a clear pattern of your heart's rate and rhythm is transmitted. It also prevents damage to the wires.

**Do not get the transmitter wet.**

- The transmitter will send a continuous pattern of your heart's rate and rhythm to a monitor at the nursing station.
- The monitor will record regular and irregular beats on paper for your doctor to see later. Your nurse will call your doctor right away, if needed.
