

How long will the test take?

- The test will take about 45 minutes.

After the test

- You can go back to your usual activities.
- The cardiologist may wish to do more tests or to examine you. They will talk with you about this.

Echocardiogram

Echocardiogram

What is an echocardiogram?

- An echocardiogram is a test to measure the size, shape, movement, and flow of blood through the heart.
- This test is safe and painless.
- Soundwaves (ultrasound) are used to get a picture of the heart which can then be seen on a computer screen.
- The pictures are saved for the cardiologist (a doctor who specializes in diseases of the heart) to review.

How do I get ready for the test?

- You **do not** need to do anything to get ready for this test.

Who will do the test?

- The test will be done by a cardiac (heart) sonographer (ultrasound specialist).

What will happen during the test?

- You will be asked to change from the waist up into a hospital gown. You can wear your own clothes from the waist down during the test.
- Small stickers called electrodes will be placed on your chest. They are connected to the ultrasound machine.
- A small amount of ultrasound jelly will be placed on your chest. This helps to make good contact between your skin and the ultrasound probe.
- The room lights will be lowered so the pictures on the computer screen can be seen easily.
- During the test, the sonographer will move the ultrasound probe around on your chest.
- The sonographer will ask you to lie on your left side.
- They may ask you to breathe in and out slowly, or to hold your breath.
- **You must stay still during the test.** Moving can make it hard for the sonographer to get the right picture.
- If the sonographer is having trouble getting a clear picture of your heart, you may have a needle injected into a vein in your arm with a medication called a contrast agent. This will help make the picture clearer.
